## **DETAILED ACTION**

### ***Drawings***

The drawings filed on 11/09/2000 have been accepted by the examiner.

### ***Allowable Subject Matter***

Claims 1-16 are allowed.

The following is an examiner's statement of reasons for allowance:

Claim 1, the prior art of record does not teach nor suggest, in the claimed combination, a magnetic drive for a switch, having an armature which is linearly displaceable between two end positions of a space, with at least one movable switch contact, having a shunt body made of a magnetizable material and arranged at a distance from the armature essentially on the axis of displacement of the armature, and having means for generating a magnetic field which exerts a retaining force on the armature holding it in the end positions, where the course of the flux lines of the magnetic field is altered by bringing the shunt body together with the armature so that the retaining force acting on the armature is reduced, wherein a lock means for the shunt body, by which the shunt body can be held in the end position facing the former and can be released from the end position by exerting a low force or power. The Prior Art of Record, in particular Morant et al. fails to teach a bistable magnetic drive system in which both the armature and the shunt body move, in particular that the shunt body itself is moveable between a position in which the shunt body presses against the form and a position moved away from the former, a lock means for a shunt body by which the

Art Unit: 2832

shunt body can be held in the end position facing the former and can be released from the end position by exerting a low force or power, the movement of the shunt body allowing the armature to latch and/or release from one of the bistable hold positions.

Claim 9, the prior art of record does not teach nor suggest, in the claimed combination, a magnetic drive for an electric switch, the electric switch including an armature linearly displaceable between two end positions of a space, the electric switch including at least one moveable switch contact, the magnetic drive comprising: a shunt body made of a magnetic material and configured to be at a distance from the armature substantially on the axis of displacement of the armature; at least one magnet and a coil configured to generate a magnetic field to exert a retaining force on the armature holding the armature in the end positions, such that the course of the flux lines of the magnetic field are altered by bringing the shunt body together with the armature such that the retaining force acting on the armature is reduced; and a lock configured to hold the shunt body in the end position facing and such that the shunt body can be released from the end position by exerting a low force. The Prior Art of Record, in particular Morant et al. fails to teach a bistable magnetic drive system in which both the armature and the shunt body move, in particular that the shunt body itself is moveable between a position in which the shunt body presses against the form and a position moved away from the former, a lock means for a shunt body by which the shunt body can be held in the end position facing the former and can be released from the end position by exerting a low force or power, the movement of the shunt body allowing the armature to latch and/or release from one of the bistable hold positions.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### ***Response to Arguments***

Applicant's arguments, filed 04/14/2010, with respect to Claims 1-8 have been fully considered and are persuasive. The rejections of claims 1-8 under Wygnanski [US 6,598,621] has been withdrawn.
